

GradieQ scanner calibration card

Version 1. Print at 100 % ("actual size", no fit-to-page) on plain white paper.

Check the print: the bar at the bottom must measure 100 mm with a ruler.

Scan the dashed box at the DPI you will scan cards with (1200 recommended), PNG or TIFF, no resizing.

Best: scan it twice - the second time with the paper turned 90 degrees on the glass.

Send the scan(s) with your first card scans. One calibration per scanner and DPI is enough.
